

# Flood Network - GDV example

<https://flood.network/>

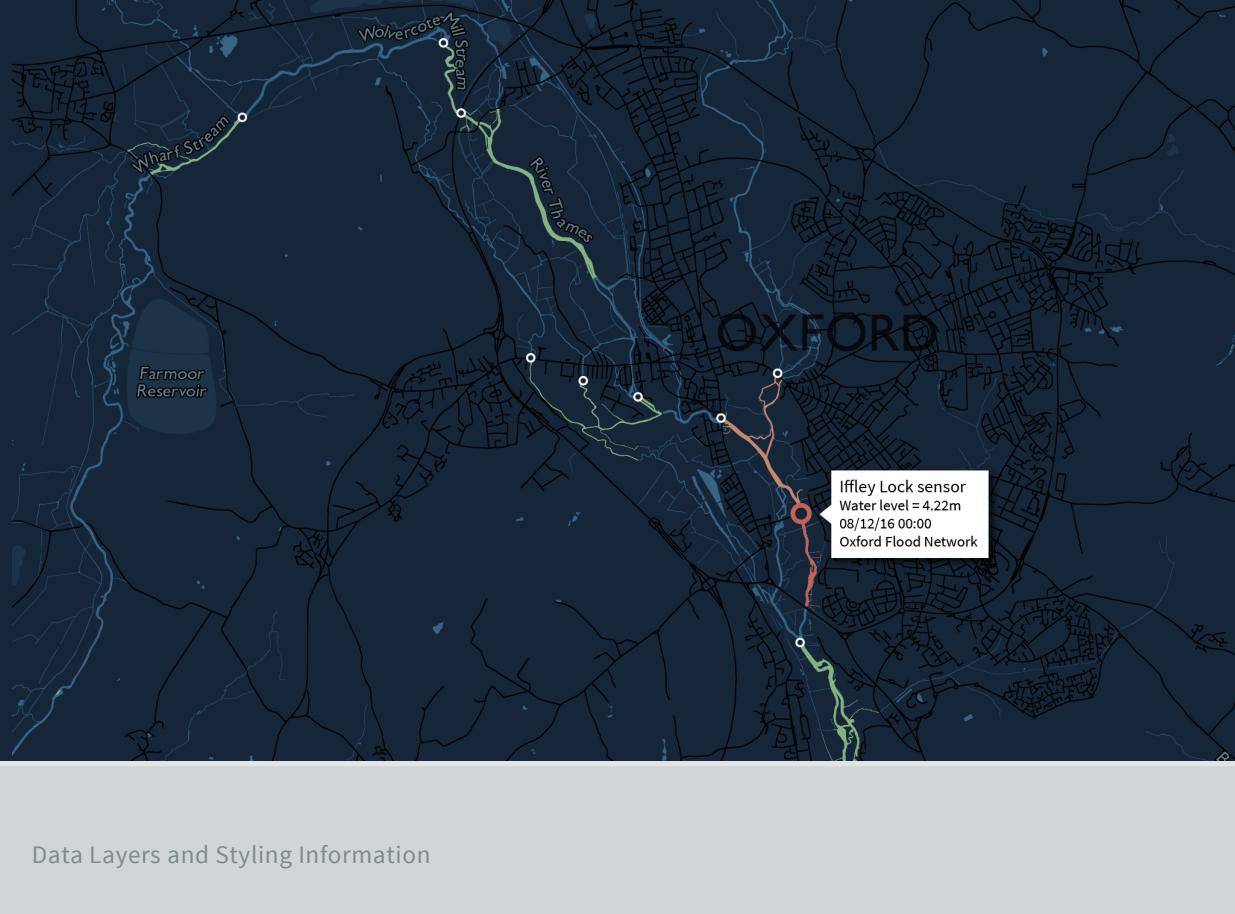

## Description

The GDV team were looking for some real examples of where good cartographic design and our new GDV toolkit could be applied. We came across a website called Flood Network, a site that visualises waterways and their levels on a map, showing where levels are high and flooding is likely. This is a great site and a great way of crowd sourcing to obtain data. However it was clear that visually it could do with some refining.
